# Introduction

How many times have you been frustrated because you cannot remember where to find that function or command in DAZ Studio you desperately need to use?

We hope that you find this 2-volume set of guides useful in quickly finding the commands and functions available to you from within DAZ Studio 4.

## *ATTENTION DEVELOPERS*

The functions/commands and descriptions listed in the text of ***Functionality for DS 4.7*** are available separately in spreadsheet format as MS Excel or Standard CSV.

# DAZ Studio Setup

Throughout this guide we will be using the abbreviation “**DS**” interchangeably for the term DAZ Studio. Our screenshots will be from the Layout “**City Limits**” and the Style “**Darkside**”. The Layout and Style you are using should not affect the Main Menu options, however if we provide additional imagery to support a command or function it may not match your DS workspace. If you are comfortable enough with DS to follow along with your own settings, you can skip this chapter. For those who wish to change their settings to match, we have provided the instructions here.

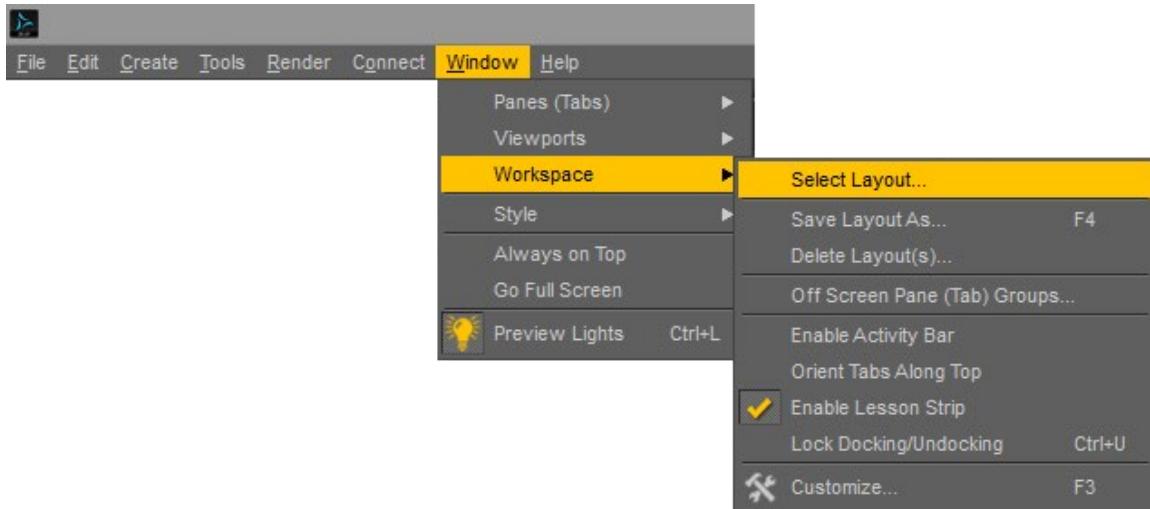

This tutorial was originally written using DAZ Studio v4.7.0.12 Pro.

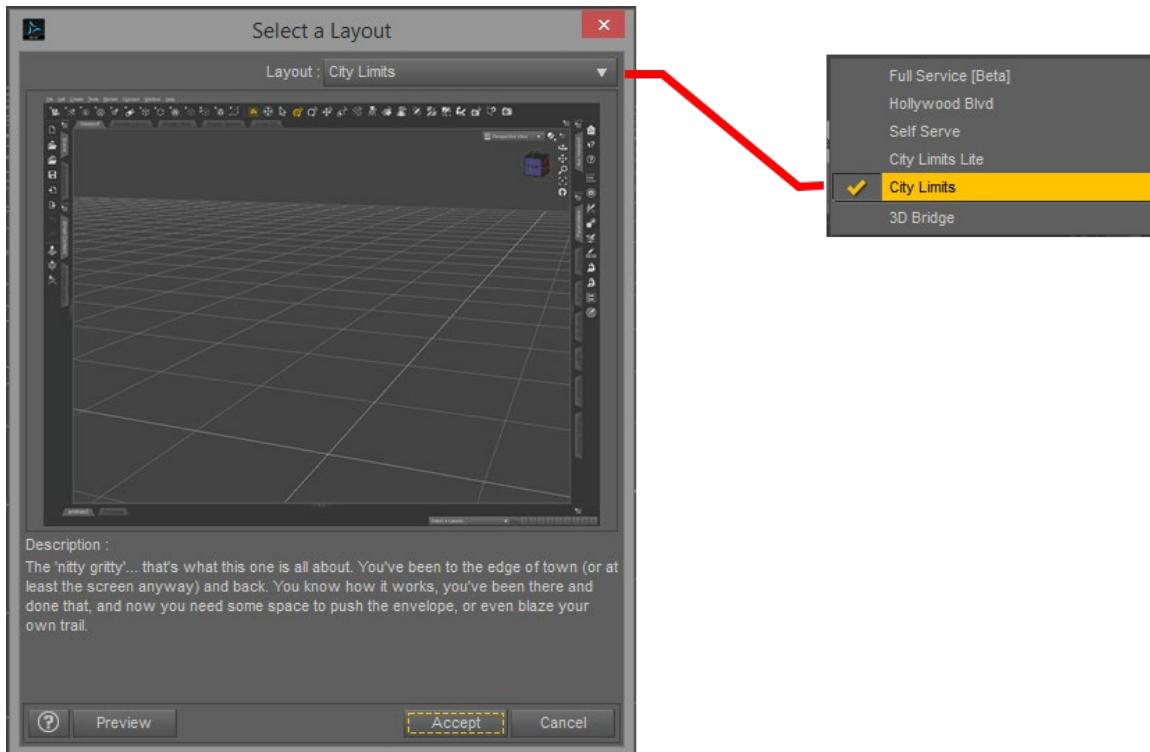

## Window Layout

On the main menu, select Window / Workspace / Select Layout.

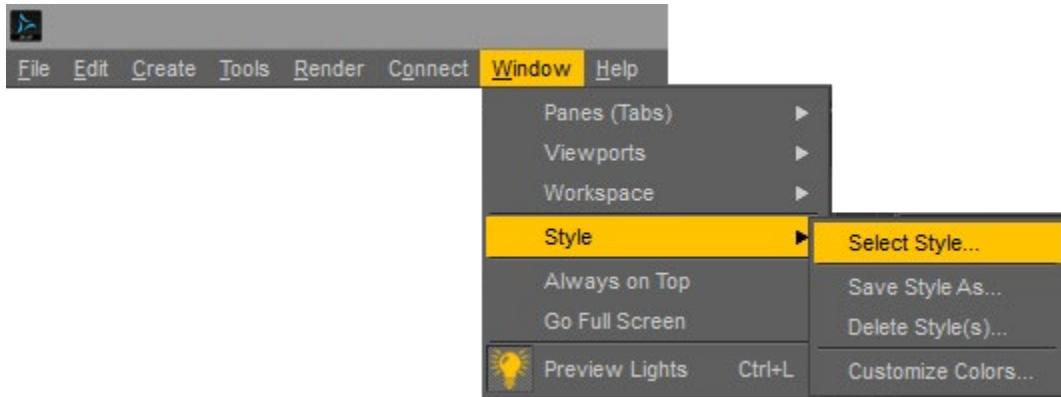

In the popup, if the Layout shown is not “City Limits”, then click the bar to open the drop-down menu so that you can change it. If you needed to change the Layout, click the “Accept” button at the bottom after making your changes.

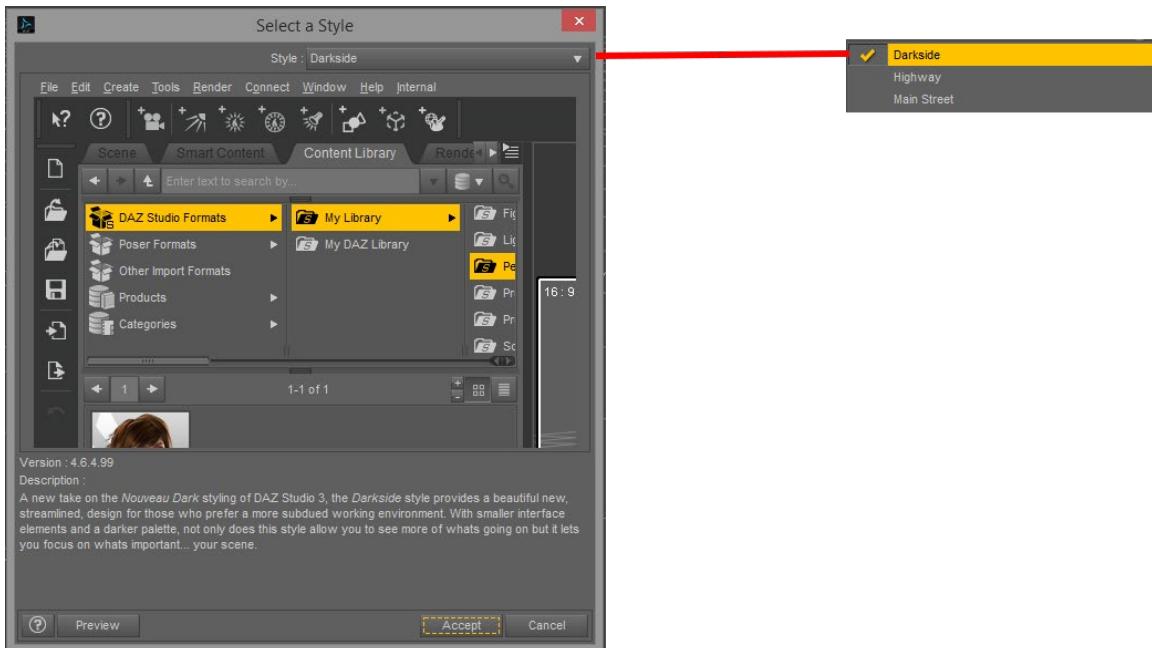

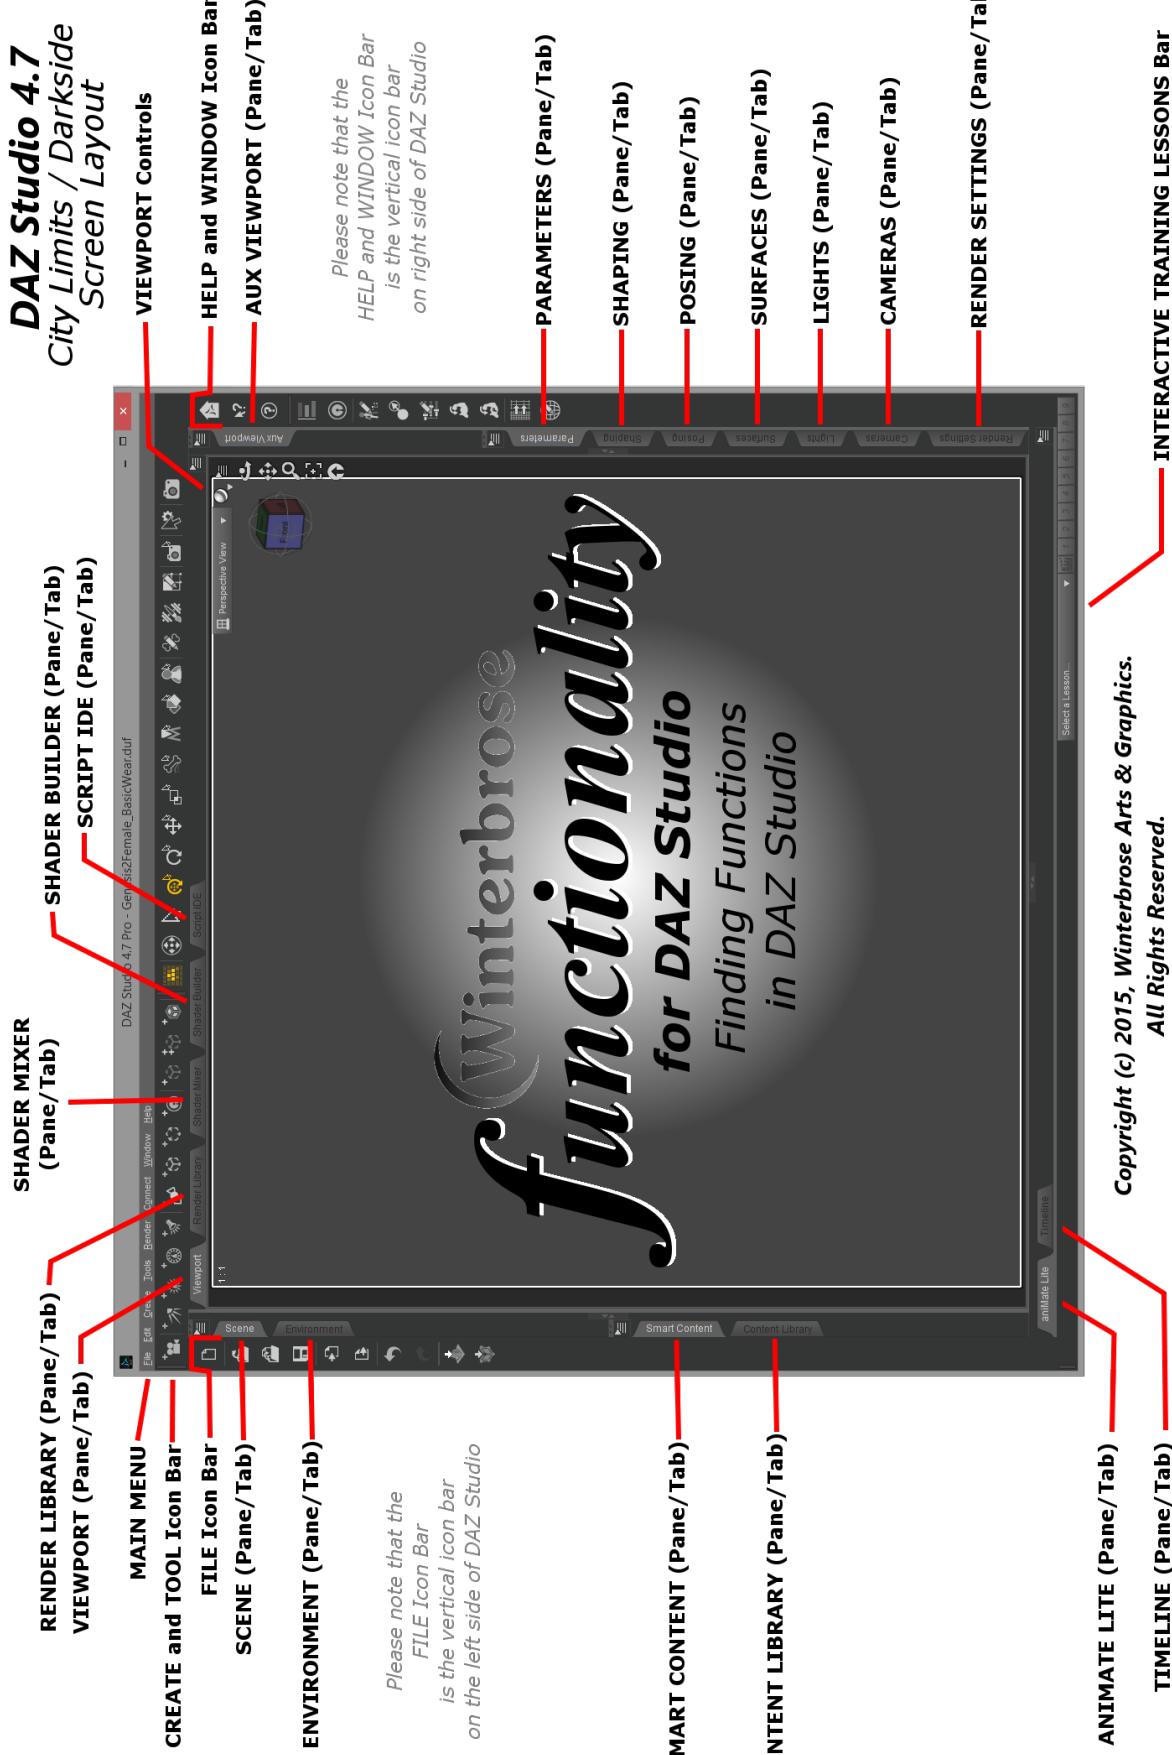

## Window Style

On the main menu, select Window / Style / Select Style.

In the popup, if the Style shown is not “Darkside” then click the bar to open the drop-down menu so that you can change it. If you needed to change the Style, then click the “Accept” button at the bottom after making your changes.

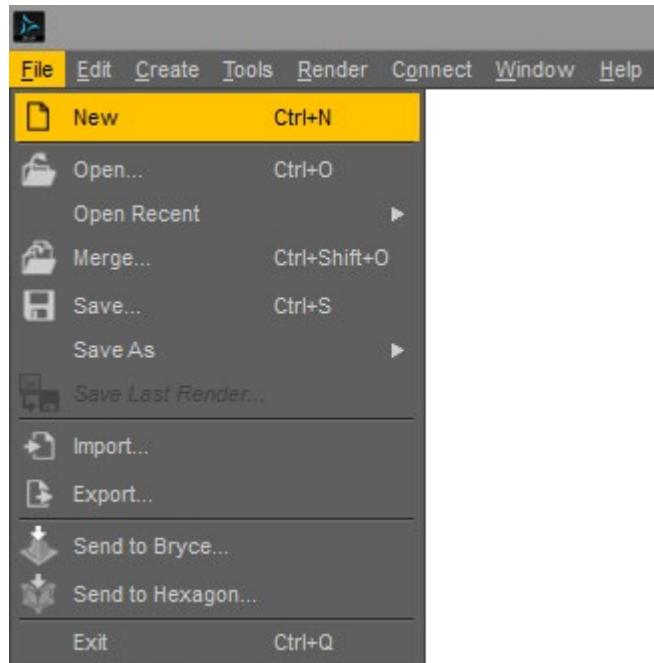

# Common Functions

*Experienced and advanced users of DAZ Studio will want to skip this section.*

There are a multitude of functions and commands available in DAZ Studio. In an attempt to assist new and less experienced artists, we have listed some of the more commonly used functions in this section for quick reference to help get you started.

## **NEW** *Start a New Scene*

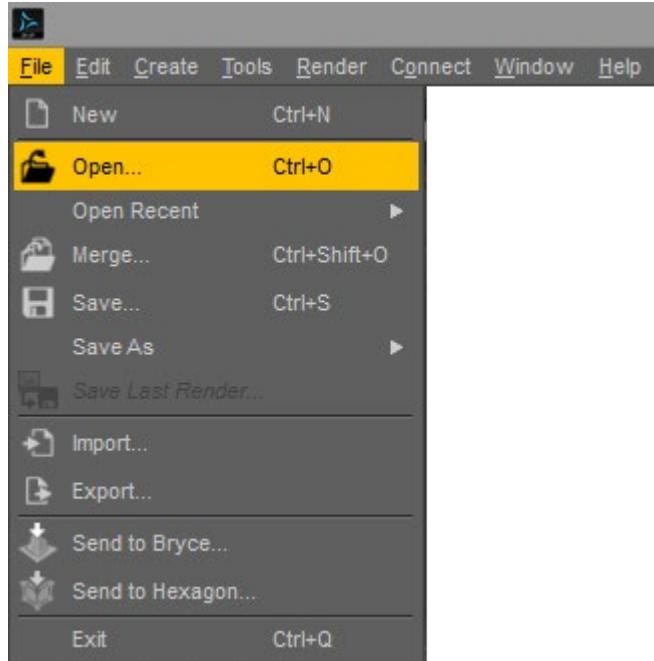

Clears the viewport and removes all contents of the current scene with a new “blank” scene ready for you to use. This action cannot be undone once completed.

## ***OPEN***

### *Load a Saved Scene*

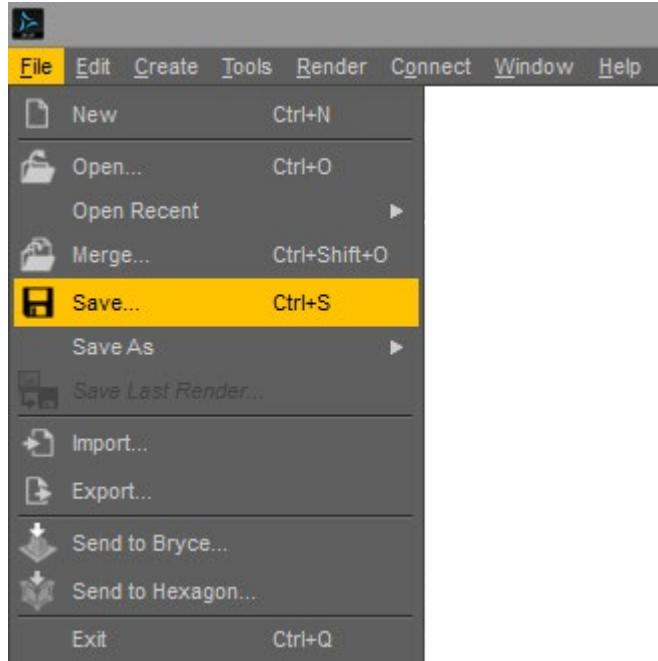

Clears the viewport and removes all contents of the current scene. A dialog will appear for you to browse for and load the saved scene you desire. This action cannot be undone once it has been completed.

## ***SAVE***

### *Save Current Scene*

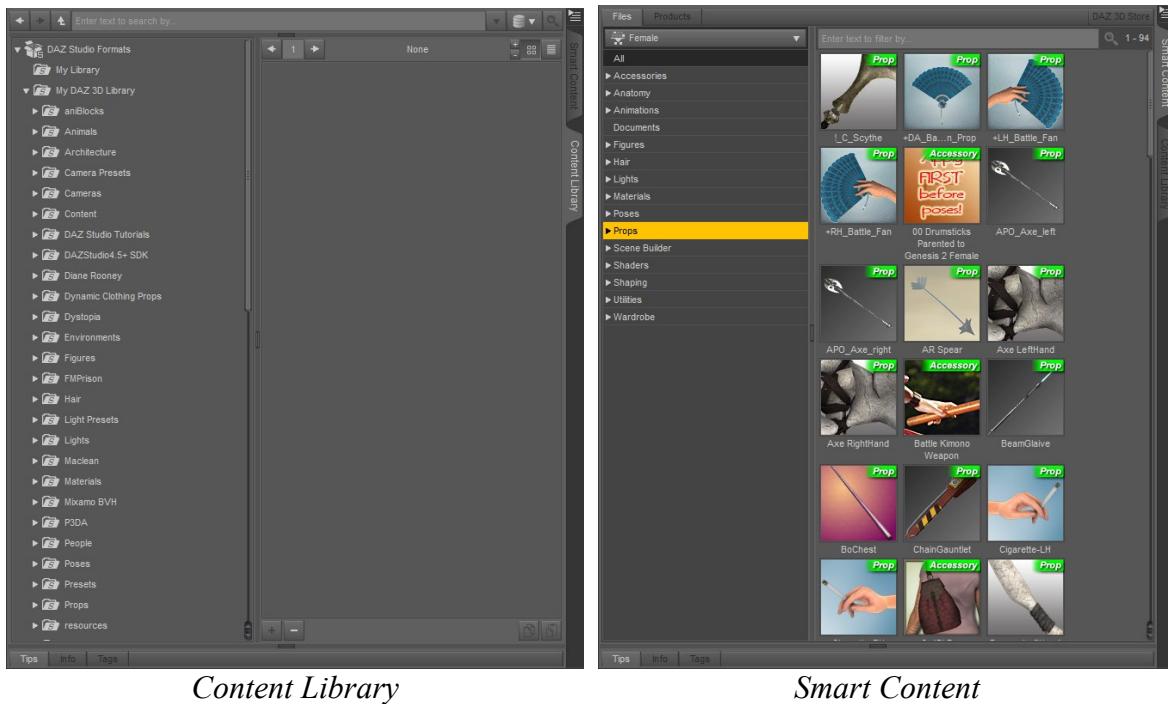

Save the current scene in the native DAZ Studio format to be used again later on.

## ***ADD OBJECTS***

### *Add Figure/Prop to Scene*

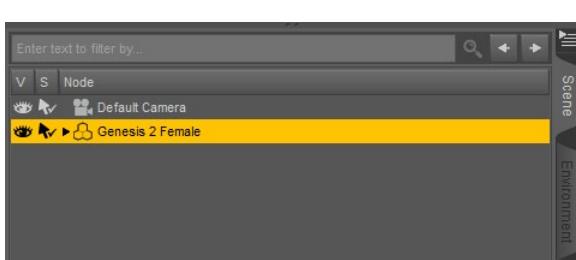

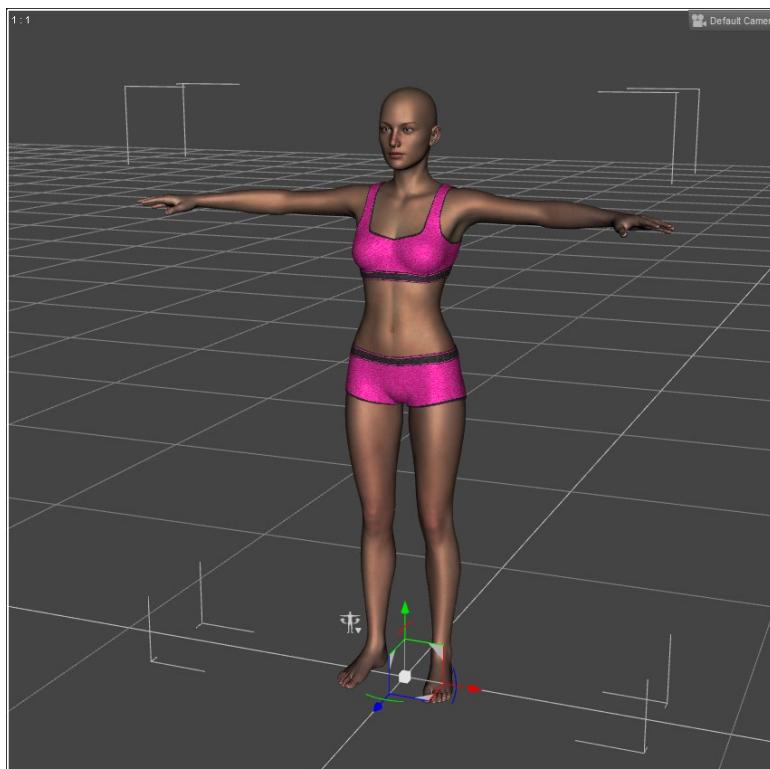

Objects like figures and props can be loaded into your scene from either the Content Library or Smart Content tabs. If you are loading items like clothing and hair that are fitted/design for a particular model, then select that object in the Scene tab before loading the prop.

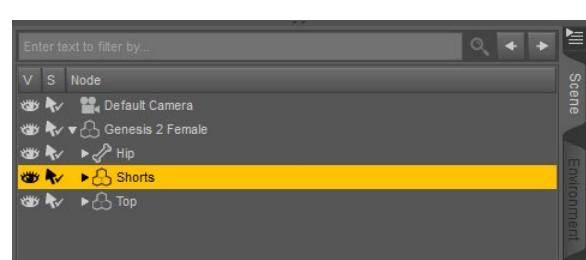

## ***SELECT OBJECTS***

### *Select a Figure/Prop in Scene*

There are several methods by which to select an object in your scene. You can click on the object in the Viewport which can be tricky if more than one object is under the mouse pointer. Or you can select the item in the Scene tab which is the method we recommend for general usage. If you use the Scene tab, note that all items in the Viewport may not be immediately shown if they are children objects.

## **ADJUST OBJECTS**

### *Change Parameters for Figure/Prop in Scene*

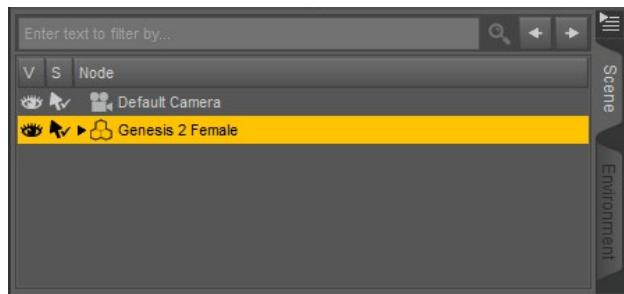

For the most part, you must select the object before you can make changes to it. Adjustments that you want to make to an object can take place in several places within the DS working environment. Transforms include actions like moving (translation), spinning (rotation) and sizing (scaling). Any adjustment to transforms can be made in the Viewport or in the Parameters pane. We recommend that you use the Parameters pane controls for fine tuning (details) objects.

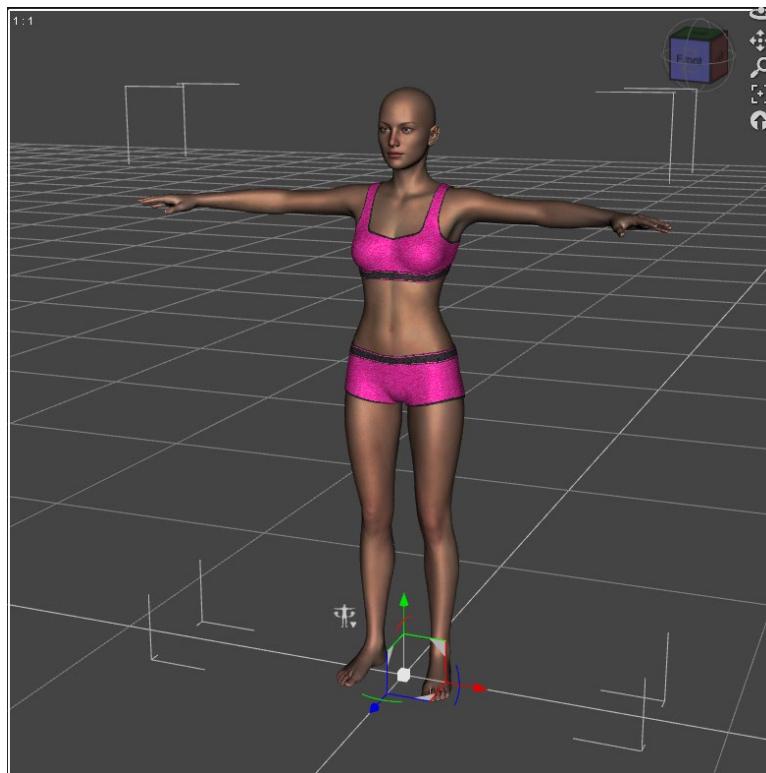

## **APPLY POSES**

### *Apply Pose Preset to Figure/Prop in Scene*

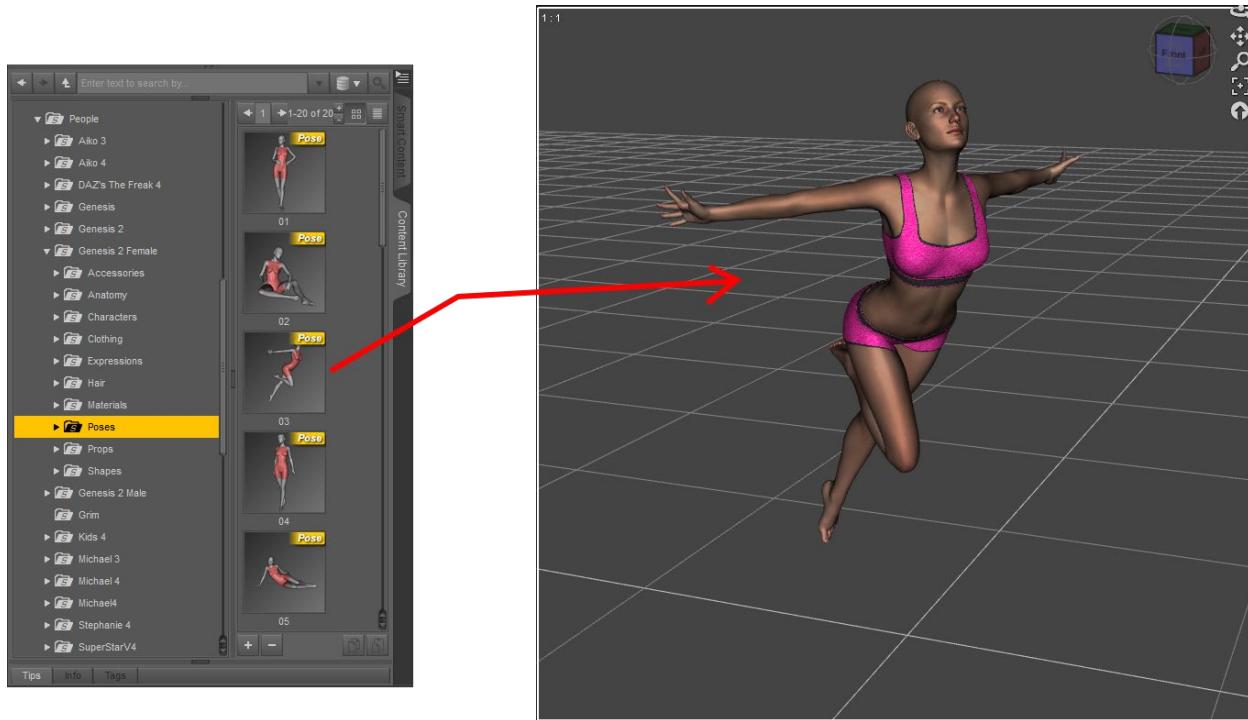

Even though you may have to make pose adjustments to objects within your scene, often you can find pose presets created by other artists that you can use immediately with little or no adjustment necessary. Select the object you want to pose and then find the icons for pose presets in Smart Content for that object. If you look in the Content Library under My DAZ 3D Library, you can usually find the pose presets in a sub-folder under the object's folder, in the Poses folder at the top-most level, or wherever the pose creator has decided to locate the pose files.

*Genesis 2 Female*

For the example shown here, we selected the Genesis 2 Female in the Scene tab and then applied the pose shown by double-clicking its thumbnail icon.

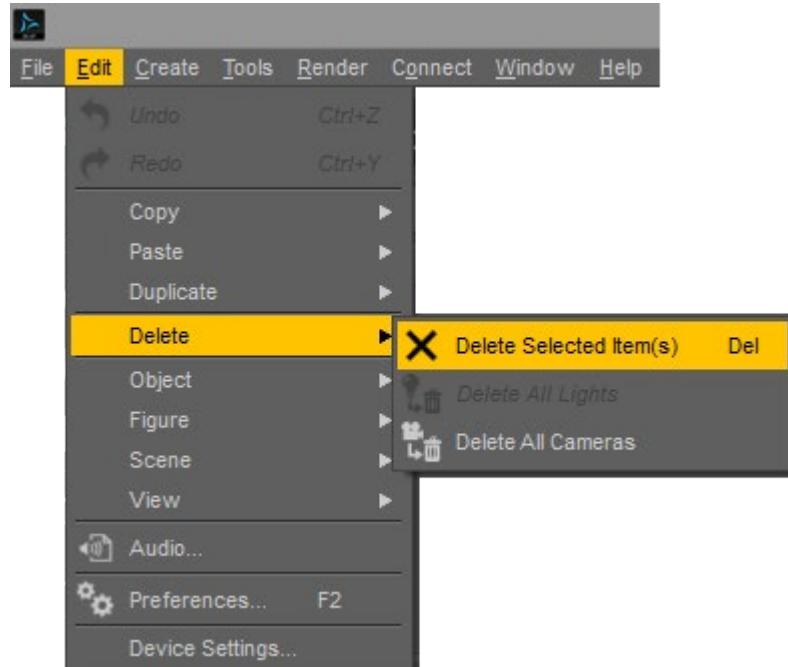

## ***REMOVE OBJECTS***

### *Delete Figure/Prop from Scene*

There are several methods by which to delete an object from your scene, all of which require the object to be selected first. You can right-click the object in the Scene tab and select Delete “object” from the popup menu. Or you can use the delete function from the main menu under Edit / Delete / Delete Selected Item(s).

*Deleting in Scene Tab*

*Deleting in Main Menu*

# **Searching Data**

# Function Finder

This section lists most functions/commands that are available grouped and sorted by location within DAZ Studio. Be sure to refer to the screen layout guide in the DAZ Studio Setup section if you do not know where to find menus and panes.
